

2. Response Documentation

1. Executive Summary

A phishing email containing a malicious link was detected and reported by a user. The email attempted to trick users into entering credentials on a fake login page. Immediate actions were taken to isolate affected systems and prevent further compromise.

2. Timeline

Timestamp	Event
14:00	Phishing email reported
14:10	Email analyzed
14:20	Malicious link identified
14:30	Endpoint isolated
15:00	Users notified

3. Impact Analysis

- Number of affected users: 2
- Systems impacted: User endpoints
- Risk level: Medium
- Data exposure: No confirmed data breach

4. Remediation Steps

- Blocked malicious URL
- Removed phishing emails from inboxes
- Reset user credentials

- Updated email security filters

5. Lessons Learned

- Improve email filtering rules
- Conduct user awareness training
- Enable multi-factor authentication (MFA)

Investigation Log

Timestamp	Action
2025-08-18 14:00:00	Phishing email detected
2025-08-18 14:10:00	Analyzed email headers
2025-08-18 14:20:00	Identified malicious link
2025-08-18 14:30:00	Isolated endpoint
2025-08-18 14:45:00	Collected system logs

Phishing Checklist

- Confirm email headers
- Check sender reputation
- Analyze email content
- Check link reputation (VirusTotal)
- Identify affected users
- Isolate affected system
- Reset credentials

Post-Mortem :

“The phishing incident highlighted the need for improved email filtering and user awareness. Faster detection and response reduced impact. Implementing multi-factor authentication and

regular training can prevent future attacks. Continuous monitoring and better communication between teams will enhance overall incident response efficiency.”
